

Do you or someone you know suffers from depression and possibly chronic pain?

Medical Researchers at UCSD Division of Geriatric Psychiatry are conducting a research study that examines the role of inflammation (bodily reaction to illness/injury) in chronic joint/muscle pain among older adults with depression.

Participants do not have to but could have chronic joint/muscle pain.

Symptoms of depression include:

- Feeling sad or blue
- Loss of interest or pleasure in things usually enjoyed
- Having low self esteem or feeling worthless
- Sleeping too little or too much
- Weight gain or increase in appetite
- Weight loss or decreased appetite
- Being fidgety or restless
- Fatigue or loss of energy
- Having trouble thinking or concentrating

We are looking for:

- Men and women
- 60 years and older
- Having depression or depressive symptoms with and without chronic pain

Qualifying participants will receive up to \$50 for a one-time evaluation that includes:

- Blood draw
- Psychological interview/medical history
- Psychological testing related to memory/thinking, mood, sleep, and pain
